Ex-13
Threat Intelligence for SOC

AIM:

To collect, analyze, and apply threat intelligence to effectively detect, prevent, and respond to cyber threats within a Security Operations Center (SOC) environment.

PROCEDURE:

- Collect threat data from multiple sources including logs, OSINT feeds, and threat intelligence platforms.
- Analyze indicators of compromise (IOCs) such as IP addresses, domains, and malware signatures.
- Correlate threat data using SIEM tools to identify patterns and attack vectors.
- Identify and classify potential threats or ongoing attacks based on correlated intelligence.
- Generate alerts, investigate incidents, and initiate appropriate response actions.

TASK-1:

- Utilising Threat Intelligence to Prevent and Detect malicious activities

Room Prerequisites

It is highly suggested to clear the following rooms first before proceeding with this room:

- Threat Intelligence Tools
- Introduction to Detection Engineering
- Tactical Detection
- Investigating with ELK 101

Let's put our intelligence to work and stay ahead of potential threats with Threat Intelligence.

Answer the questions below

Let's start!

No answer needed — ✓ Correct Answer

TASK-2:

```
107[.]175[.]202[.]158
109[.]206[.]240[.]194
```

Answer the questions below

How many unique IP addresses were provided in the IOC list?

11 — ✓ Correct Answer

Based on the set of IOCs, how many IOC hits were discovered in the logs?

48 — ✓ Correct Answer

Out of the total number of IOCs, how many unique IP addresses were discovered in the logs?

7 — ✓ Correct Answer

How many connections were made to 185[.]224[.]128[.]215?

21 — ✓ Correct Answer

What is the IP address of the compromised host?

10.10.196.49 — ✓ Correct Answer

What is the destination port of connections made to 107[.]175[.]202[.]151?

80 — ✓ Correct Answer

TASK-3:

Answer the questions below

How many DNS queries to agrosaoxe[.]info have been created?

11 — ✓ Correct Answer

Before deploying the sinkhole configuration, what IPv4 addresses are resolved by agrosaoxe[.]info? (format: IPs in ascending order)

104.21.48.143,172.67.186.179 — ✓ Correct Answer

What is the IP address used for DNS Sinkhole?

192.168.5.13 — ✓ Correct Answer

How many hits were caused by connections to sinkholed domains?

115 — ✓ Correct Answer

How many unique domains have been sinkholed?

12 — ✓ Correct Answer

TASK-4:

Answer the questions below

What is the value of the alert field in the converted ElastAlert rule?

debug — ✓ Correct Answer

How many alerts were generated by the rule?

40 — ✓ Correct Answer

How many unique domains were sinkholed via 0.0.0.0?

7 — ✓ Correct Answer

What is the sinkholed domain that has .ru TLD?

twizt.ru — ✓ Correct Answer

TASK-5:

To conclude, this room focused on leveraging Threat Intelligence to improve the overall capabilities of a Security Operations Center, ranging from detection capabilities to preventive mechanisms that mitigate entirely known threats.

In this world of ever-evolving threats, we need to utilise every ounce of knowledge to protect our organisation, including all the intelligence provided by organisations that serve as Producers and bits of meaningful feedback from Consumers. Through collaboration, we can protect and improve the security posture of every organisation.

If you enjoyed this room, continue learning detection engineering concepts by proceeding to Rule Tuning (coming soon!) and Alert Enrichment (coming soon!).

Answer the questions below

Continue putting that intelligence to use!

No answer needed — ✓ Correct Answer

RESULT:

Threat intelligence was successfully collected, correlated, and applied within a SOC environment. IOC-based analysis revealed compromised hosts, suspicious IP connections, and sinkholed domains. ElastAlert rules were configured to generate targeted alerts, significantly improving threat detection accuracy and incident response time. The experiment demonstrated how proactive use of threat intelligence enhances the overall security posture and reduces exposure to cyber risks.
